

Elcomsoft Internet Password Breaker Version 3.10

Elcomsoft Internet Password Breaker instantly extracts passwords, stored forms and AutoComplete information from popular Web browsers and email clients. Obtain individual passwords or export all data in order to build a perfect custom dictionary for password recovery attacks performed with other tools.

Summary

In this release, Elcomsoft Internet Password Breaker receives an update to add compatibility with the newest addition to the Web browser family. This release introduces support for the latest Chromium-based Microsoft Edge browser for both 32-bit and 64-bit Windows editions. In addition, the tool was updated to support the latest builds of Google Chrome, Opera and Chromium.

Essential updates

The Chrome update

The latest versions of Chrome no longer employ Microsoft DPAPI for protecting stored passwords. Instead, the passwords are protected with industry-standard AES 256 GCM encryption, while DPAPI is only used to protect the vault encryption key. The latest versions of Opera, Chromium, and new Microsoft Edge browsers are based on the same encryption scheme. Elcomsoft Internet Password Breaker 3.10 was updated to support the latest encryption scheme employed in the latest versions of Chromium-based Web browsers.

Microsoft Edge (Chromium edition)

With Microsoft planning to ship the new Chromium-based Edge browser with every Windows installation, Microsoft Edge can become Chrome's major competitor. Thanks to using the same engine as Google Chrome, Microsoft is offering a straightforward migration path by importing data including stored passwords in a click of a button. New Elcomsoft Internet Password Breaker 3.10 retrieves user-saved and synchronized passwords from the new Microsoft Edge (Chromium) browser, both 32-bit and 64-bit.

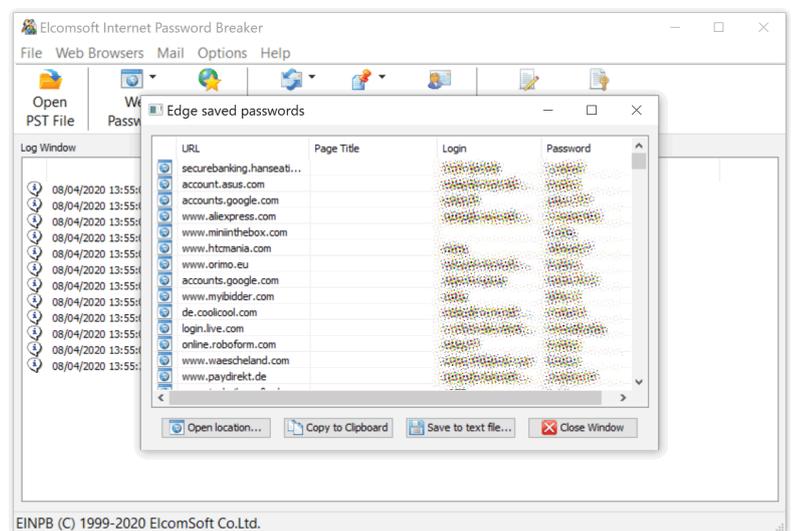

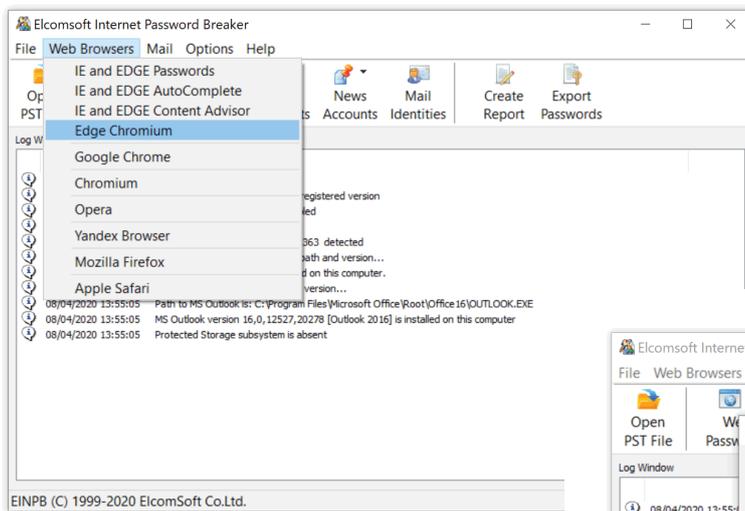

Updates for other popular browsers

The new version of Elcomsoft Internet Password Breaker is compatible with newest versions of the most common web browsers, Opera and Chromium, allowing instantly extracting stored passwords.

Version 3.10 change log

- New: added support for Microsoft Edge (Chromium-based)
- Updated: support for the latest versions of Google Chrome
- Updated: added support for new versions of Opera
